PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN KS1

NATURE OF THE ACTIVITIES SUGGESTED HERE

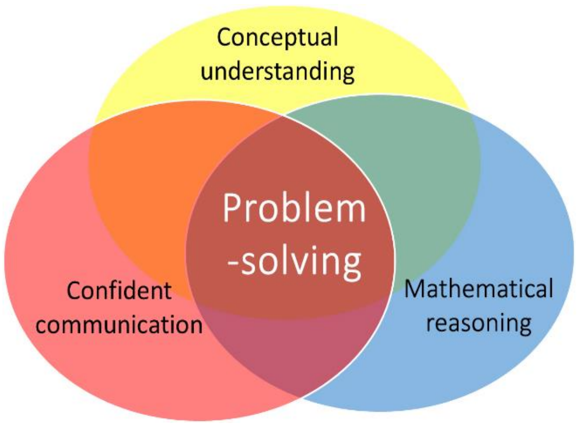
With the surge of interest and sometimes confused interpretations of what is meant by ***Mastery*** in mathematics, a number of different claims have been made about what it means and what is required. The efficacy of different approaches to implementing a Mastery approach to learning mathematics in the primary school, as demonstrated by higher performing jurisdictions in the Far East, as measured by PISA* and TMSS* have been questioned and challenged.

However, there are some essential points that appear to be in common when examining different approaches.

Research in mathematics education, which curriculum developers and educationalists in the Far East have used, have been known for many years and including Bloom's* theories of *Mastery,* the development of *deeper conceptual understanding* through a progression in *Concrete-Pictorial-Abstract (CPA)* experiences, first discovered by Bruner*, the *realistic mathematics education* of Freudenthal*, and the seminal *Cockcroft Report*,* particularly, its emphasis on the importance of *practical experiences* and *problem-solving*. More recently, Lo's* research in the subject of *Variation Theory* has been prominent in exploring how to plan learning for understanding through small steps in conceptual and procedural variation when teaching.

All of these principles have informed the sample of activities presented here. Proponents of Mastery in mathematics (e.g. Drury*) also argue that teaching and learning must focus on enabling children to develop ***rich connections*** between different facets of their mathematical experience and learning. These aims are also highlighted in the 2014 National Curriculum Aims*. The diagram below shows how these facets are all inter-related, and how teaching to connect these is crucial to ***deeper mathematical learning.***

Hence, the activities suggested here are designed to promote the following:



- practical activity manipulating concrete resources where possible;
- working in pairs or groups to encourage the confident use of the language of mathematics through explanation and reasoning with other children;
- ensuring that formal written arithmetic develops from secure experiences with concrete, visual and mental understanding of the manipulation of number and the arithmetic operations;
- solving problems (or by playing games) with the potential for a useful or pleasing result;
- opportunities for finding more than one acceptable result, which children can compare and discuss through collaboration or (guided) peer-assessment.

There is an expectation that discussion and exploration of misconceptions or errors is a healthy and productive feature of the classroom and that children are encouraged to explain their thinking and listen to others.

NATURE OF THE ACTIVITIES SUGGESTED HERE

In some of the activities, it could be argued that a written sheet of exercises could be given to produce similar results. However, the use of concrete apparatus and visual images provides a medium for discussion and helps to establish a rich conceptual understanding, which is often insufficiently developed through an abstract engagement with written exercises alone. In other cases, children are using equipment to generate the problem to be solved, so can be more engaged in its solution.

Where it is suggested pairs or groups of children work together, the groups may of course be varied to suit the teacher's own judgement. For example, in a game intended for pairs, an odd number of children can be accommodated by a changing combination of 2 vs 1.

To make it more accessible when reading the description of the activities, children's names have been used to identify the sequence of interactions between learners working in pairs or groups.

For every activity, it is paramount that the teacher teaches by modelling the activity with the class, so that children see and imitate what they need to do. Simply providing a written instruction sheet or verbal series of instructions is insufficient for the children to understand and engage with most activities.

Each activity has suggestions for extending or simplification. The expectation is that each can be explored comprehensively within one classroom lesson of 45 minutes or more.

10. Multiplication and Division Structures **Use the inverse-of-multiplication (repeated subtraction) structure to understand division.** One problem in developing children's understanding of division is that concrete experiences in the lower primary years can overstate the equal-sharing structure. The equal-sharing structure is the basis of fractions, written methods of division, swap between equal-sharing and the inverse-of-multiplication (equal grouping or repeated subtraction). This activity is intended to develop children's understanding of the latter.	<u>**How many groups?**</u> Children take a given number of multilink and make a joined row of single cubes. They then see how many equal groups of the same length which they can break the row into without any left over. They write the division sentences for each one. For example, starting with a row 10 cubes long:  Emily tells Luke they can make groups of 2, and demonstrates this:  They both write the number sentence: *10 ÷ 2 = 5* Luke puts the row back together and attempts to break it into groups of 3, but finds he has 1 cube left over. Emily suggests groups of 4, but they find there are 2 cubes left. They find groups of 5:  And write the next number sentence: *10 ÷ 5 = 2* They then do the same for other numbers, such as 9, 12, 16, 11 ... The activity can be simplified or extended by changing the numbers set for the rows the children are to make.	When dividing the tower, every group has to be the same size, with no cubes left over. Emphasising the language '***equal groups of***' and that the children are ***subtracting*** the ***same*** group ***many*** times. Children may still confuse which value represents the ***group size or number in each group***, with the value which represents the ***number of groups*** when writing a number sentence. Children should begin to see that some numbers (primes) can only be one single group or grouped in *ones.*
