

NATURE OF THE ACTIVITIES SUGGESTED HERE

With the surge of interest and sometimes confused interpretations of what is meant by **Mastery** in mathematics, a number of different claims have been made about what it means and what is required. The efficacy of different approaches to implementing a Mastery approach to learning mathematics in the primary school, as demonstrated by higher performing jurisdictions in the Far East, as measured by PISA* and TMSS* have been questioned and challenged.

However, there are some essential points which appear to be in common when examining different approaches.

Research in mathematics education, that curriculum developers and educationalists in the Far East have used, have been known for many years and including Bloom's* theories of *Mastery*, the development of *deeper conceptual understanding* through a progression in *Concrete-Pictorial-Abstract (CPA)* experiences, first discovered by Bruner*, the *realistic mathematics education* of Freudenthal*, and the seminal *Cockcroft Report**, particularly, its emphasis on the importance of *practical experiences* and *problem-solving*. More recently, Lo's* research in the subject of *Variation Theory* has been prominent in exploring how to plan learning for understanding through small steps in conceptual and procedural variation when teaching.

All of these principles have informed the sample of activities presented here. Proponents of Mastery in mathematics (e.g. Drury*) also argue that teaching and learning must focus on enabling children to develop **rich connections** between different facets of their mathematical experience and learning. These aims are also highlighted in the 2014 National Curriculum Aims*. The diagram below shows how these facets are all inter-related, and how teaching to connect these is crucial to **deeper mathematical learning**.

Hence, the activities suggested here are designed to promote the following:

- practical activity manipulating concrete resources where possible;
- working in pairs or groups to encourage the confident use of the language of mathematics through explanation and reasoning with other children;
- ensuring that formal written arithmetic develops from secure experiences with concrete, visual and mental understanding of the manipulation of number and the arithmetic operations;
- solving problems (or by playing games) with the potential for a useful or pleasing result;
- opportunities for finding more than one acceptable result, which children can compare and discuss through collaboration or (guided) peer-assessment.

NATURE OF THE ACTIVITIES SUGGESTED HERE

There is an expectation that discussion and exploration of misconceptions or errors is a healthy and productive feature of the classroom and that children are encouraged to explain their thinking and listen to others.

In some of the activities, it could be argued that a written sheet of exercises could be given to produce similar results. However, the use of concrete apparatus and visual images provides a medium for discussion and helps to establish a rich conceptual understanding, which is often insufficiently developed through an abstract engagement with written exercises alone. In other cases, children are using equipment to generate the problem to be solved, so can be more engaged in its solution.

Where it is suggested pairs or groups of children work together, the groups may of course be varied to suit the teacher's own judgement. For example, in a game intended for pairs, an odd number of children can be accommodated by a changing combination of 2 vs 1.

To make it more accessible when reading the description of the activities, children's names have been used to identify the sequence of interactions between learners working in pairs or groups.

For every activity, it is paramount that the teacher teaches by modelling the activity with the class, so that children see and imitate what they need to do. Simply providing a written instruction sheet or verbal series of instructions is insufficient for the children to understand and engage with most activities.

Each activity has suggestions for extending or simplification. The expectation is that each can be explored comprehensively within one classroom lesson of 45 minutes or more.

<p>16. Decimal Numbers and Rounding</p> <p>Identify the value of each digit in numbers given to three decimal places.</p> <p>Round decimal numbers to one decimal place.</p> <p>Quite often, we expect children to round numbers up or down to the nearest tenth. This activity helps the children to see this through an inverse approach. Being given the rounded figure, how imaginative can they be in finding different numbers which will round to this amount?</p>	<p>Round about Children work in pairs.</p> <p>Display the numbers 3.172, 3.2, 3.177, 3.17, 3.271, 3.1 and, through discussion with the children, put these into ascending order (3.1, 3.17, 3.172, 3.177, 3.2, 3.271).</p> <p>Now ask the children to round all the given numbers to the nearest tenth (one decimal place), to give: 3.1, 3.2, 3.2, 3.2, 3.2, 3.3. Note that four of them round to 3.2 to the nearest tenth.</p> <p>Ask the children if they can find <i>4 more</i> different numbers with two or three decimal places that round to 3.2 (to the nearest tenth, for example 3.215, 3.19, 3.23, 3.192).</p> <p>Charlie and Meena now work as a pair to write, in order, eight different numbers with two or three decimal places in each case that all round to the same number to the nearest tenth, for example: to 4.5, 6.9, 12.1, 271.4.</p> <p>Extend this by challenging children to find numbers with more decimal places which round to one decimal place, and then to two decimal places.</p>	<p>When comparing two numbers, do the children realise that the one with more decimal places is not necessarily the larger number?</p> <p>Do they realise that they must compare each of the values in the <i>same decimal place</i>, working from the left-most digit, when placing them in order?</p> <p>Do children see that only the value the <i>first</i> decimal place to the right of the rounded number of places has any impact on whether it is rounded up or down? E.g. 5.192 rounds to 5.2 whereas 5.149 rounds to 5.1, both owing to the value of the <i>100ths</i> decimal place.</p> <p>Similarly, to two decimal places, 5.4948 rounds to 5.49 and 5.4973 rounds to 5.5 owing to the values of the <i>1000ths</i> place.</p>
