

PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN UPPER PRIMARY

5-6

NATURE OF THE ACTIVITIES SUGGESTED HERE

With the surge of interest and sometimes confused interpretations of what is meant by **mastery** in mathematics, different claims have been made about **mastery** and what is required. The efficacy of different aspects of mastery approaches to learning mathematics in the primary school, as demonstrated by higher performing jurisdictions in East Asia, as measured by PISA* and TIMSS* have been questioned and challenged.

However, there are some essential points which appear to be in common when examining different approaches.

Research in mathematics education, already known for many years, has been used by curriculum developers and educationalists in East Asia, including Bloom's* theories of **mastery**, the development of **deeper conceptual understanding** through a progression in **Concrete-Pictorial-Abstract (CPA)** experiences, first discovered by Bruner*, the **realistic mathematics education** of Freudenthal*, More recently, Lo's* research in the subject of **Variation Theory** has been prominent in exploring how to plan learning for understanding through small steps in conceptual and procedural variation when teaching.

All of these principles have informed the sample of activities presented here. Proponents of **mastery** in mathematics (e.g. Drury*) also argue that teaching and learning must focus on enabling children to develop **rich connections** between different facets of their mathematical experience and learning. The diagram below shows how these facets are all inter-related, and how teaching to connect these is crucial to **deeper mathematical learning**.

Hence, the activities suggested here are designed to promote the following:

- practical activity manipulating concrete resources where possible;
- working in pairs or groups to encourage the confident use of the language of mathematics through explanation and reasoning with other children;
- ensuring that formal written arithmetic develops from secure experiences with concrete, visual and mental understanding of the manipulation of number and the arithmetic operations;
- solving problems (or by playing games) with the potential for a useful or pleasing result;
- opportunities for finding more than one acceptable result, which children can compare and discuss through collaboration or (guided) peer-assessment.

There is an expectation that discussion and exploration of misconceptions or errors is a healthy and productive feature of the classroom and that children are encouraged to explain their thinking and listen to others.

PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN UPPER PRIMARY

5-6

NATURE OF THE ACTIVITIES SUGGESTED HERE

In some of the activities, one may argue that a written sheet of exercises could be given to produce similar results. However, the use of concrete apparatus and visual images provides a medium for discussion and helps to establish a rich conceptual understanding, which is often insufficiently developed through an abstract engagement with written exercises alone. In other cases, children are using equipment to generate the problem to be solved, so can be more engaged in its solution.

Where it is suggested pairs or groups of children work together, the groups may of course be varied to suit the teacher's own judgement. For example, in a game intended for pairs, an odd number of children can be accommodated by a changing combination of 2 vs 1.

To make it more accessible when reading the description of the activities, children's names have been used to identify the sequence of interactions between learners working in pairs or groups.

For every activity, it is paramount that the teacher teaches by modelling the activity with the class, so that children see and imitate what they need to do. Simply providing a written instruction sheet or verbal series of instructions is insufficient for the children to understand and engage with most activities.

Each activity has suggestions for extending or simplification. The expectation is that each can be explored comprehensively within one classroom lesson of 45 minutes or more.

PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN UPPER PRIMARY

5-6

10. Multiplication and Division Structures

Use the inverse-of-multiplication structure with ad hoc strategies to solve a division.

The aim here is to reinforce the children's understanding of the relationship between multiplication and division, showing how they can use multiplication to carry out a division. They also develop strategies to find unknown multiplication facts from those facts that they have already established.

Division by multiplying! The children will need to have had experience of finding some multiplications they don't know using number facts they do know in ad hoc ways.

For example, from $6 \times 3 = 18$, they can work out:

$$6 \times 6 = 36 \text{ (by doubling } 6 \times 3\text{);}$$

$$6 \times 30 = 180 \text{ (by multiplying } 6 \times 3 \text{ by } 10\text{);}$$

$$6 \times 60 = 360 \text{ (by multiplying } 6 \times 6 \text{ by } 10\text{), and so on.}$$

Now for the problem: the children have been asked by the car manufacturer 'Nissota' to work out the sizes of petrol tanks needed for different models of its new cars. Nissota wants each car to be able to drive at least 500 kilometres between visits to filling stations. The company needs to know the minimum size each car's fuel tank must be in litres. Here is a table of the number of kilometres per litre of petrol each new model can drive:

Model of car	SuperExec	GazGuy	Missive	Yazz	Wego
kilometres /litre	6	8	11	12	14

(See worksheets.)

The teacher models an example with the children: Rival car manufacturer 'Kionda' has a car which goes 7 kilometres on 1 litre of petrol. To find how much petrol is needed to drive at least 500 kilometres, we will build up gradually to that figure. This can be done in a number of ways, depending on the child's confidence with mental multiplication by 7. For example:

10 litres will cover $7 \times 10 = 70$ kilometres;

so 20 litres will cover $7 \times 20 = 140$ kilometres (doubling the result for 10 litres);

and 40 litres will cover $7 \times 40 = 280$ kilometres (doubling the result for 20 litres);

but 80 litres would cover $7 \times 80 = 560$ kilometres (doubling again, but this is too large);

so 60 litres will cover $140 + 280 = 420$ kilometres (adding results for 20 litres and 40 litres);

so 70 litres will cover $420 + 70 = 490$ kilometres (adding results for 60 litres and 10 litres);

Are the children confident in adapting and developing new calculations from those they already know?

Can they do this methodically to develop a progressive sequence of facts?

With successive calculations, do the children use what they already know to find the largest multiples as soon as possible wherever they can? This will help when developing vertical written methods of division too.

Children need to be confident in scaling multiplication facts by 10 and 100.

PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN UPPER PRIMARY

5-6

and 2 litres will cover $7 \times 2 = 14$ kilometres.

So if we add the results for 70 litres and 2 litres we pass the 500 kilometres target: $390 + 14 = 504$ kilometres. So to travel at least 500 kilometres the Kionda car's petrol tank needs to hold at least $70 + 2 = 72$ litres.

Meena and Charlie now use the same approach each work out the minimum size of each Nissota model's fuel tank in litres. They compare their strategies and check each other's calculation.

To simplify this use only single-digit kilometre/litre figures or reduce the minimum driving distance to, say, 200 kilometres.

To make it more of a challenge, add some more economical models, for example with fuel consumption at 19 or 23 kilometres /litre or extend the driving range to, say, 550 kilometres or 720 kilometres.
