# PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY In lower primary

### NATURE OF THE ACTIVITIES SUGGESTED HERE

With the surge of interest and sometimes confused interpretations of what is meant by *mastery* in mathematics, different claims have been made about *mastery* and what is required. The efficacy of different aspects of mastery approaches to learning mathematics in the primary school, as demonstrated by higher performing jurisdictions in East Asia, as measured by PISA\* and TIMSS\* have been questioned and challenged.

However, there are some essential points that appear to be in common when examining different approaches.

Research in mathematics education, already known for many years, has been used by curriculum developers and educationalists in East Asia, including Bloom's\* theories of *Mastery*, the development of *deeper conceptual understanding* through a progression in *Concrete-Pictorial-Abstract (CPA)* experiences, first discovered by Bruner\*, the *realistic mathematics education* of Freudenthal\*. More recently, Lo's\* research in the subject of *Variation Theory* has been prominent in exploring how to plan learning for understanding through small steps in conceptual and procedural variation when teaching.

All of these principles have informed the sample of activities presented here. Proponents of *mastery* in mathematics (e.g. Drury\*) also argue that teaching and learning must focus on enabling children to develop *rich connections* between different facets of their mathematical experience and learning. The diagram below shows how these facets are all inter-related, and how teaching to connect these is crucial to *deeper mathematical learning*.

Hence, the activities suggested here are designed to promote the following:

- practical activity manipulating concrete resources where possible;
- working in pairs or groups to encourage the confident use of the language of mathematics through explanation and reasoning with other children;
- ensuring that formal written arithmetic develops from secure experiences with concrete, visual and mental understanding of the manipulation of number and the arithmetic operations;
- solving problems (or by playing games) with the potential for a useful or pleasing result;
- opportunities for finding more than one acceptable result, which children can compare and discuss through collaboration or (guided) peer-assessment.

There is an expectation that discussion and exploration of misconceptions or errors is a healthy and productive feature of the classroom and that children are encouraged to explain their thinking and listen to others.

# PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY In lower primary

#### NATURE OF THE ACTIVITIES SUGGESTED HERE

In some of the activities, one may argue that a written sheet of exercises could produce similar results. However, the use of *concrete apparatus* and *visual images* provides a medium for discussion and helps to establish a rich conceptual understanding, which is often insufficiently developed through an abstract engagement with written exercises alone. In other cases, children are using equipment to generate the problem to be solved, so can be more engaged in its solution.

Where it is suggested pairs or groups of children work together, the groups may of course be varied to suit the teacher's own judgement. For example, in a game intended for pairs, an odd number of children can be accommodated by a changing combination of 2 vs 1.

To make it more accessible when reading the description of the activities, children's names have been used to identify the sequence of interactions between learners working in pairs or groups.

For every activity, it is paramount that the teacher teaches by modelling the activity with the class, so that children see and imitate what they need to do. Simply providing a written instruction sheet or verbal series of instructions is insufficient for the children to understand and engage with most activities.

Each activity has suggestions for extending or simplification. The expectation is that each can be explored comprehensively within one classroom lesson of 45 minutes or more.

15. Fractions and Ratios	Sharing the sweets Children work in pairs. Each pair will need:	Do the children connect the
Recognise, find, name and write fractions $1/4$ , $1/2$ , $2/4$ , and $3/4$ of a set of objects or quantity.	<ul> <li>Counters (for <i>sweets</i>) in prepared paper bags of 4, 8, 12 and 16;</li> <li>Four 'soft toys', say <i>Teddy, Rover, Froggy and Rabbit</i> to be the recipients of sharing the sweets;</li> <li><i>Post-it notes,</i> placed on a maths mat, one in front of each soft toy, used as 'plates' to collect the sweets.</li> </ul>	number who are sharing and the fraction this produces? Do they see that every fraction must be an equal share of the number of
To enable children to develop a solid	<ul> <li>Halves: Sharing equally between two toys:</li> <li>Starting with the bag of 4 sweets, show the children how to share the sweets equally.</li> </ul>	sweets?
understanding of fractions, it is important for them to have as much practical experience as possible in which they associate the language and notation used to express fractions with concrete examples. This activity concentrates on finding fractions of a number, as many of children's experiences of fractions are likely to be with shape.	<ul> <li>Starting with the bag of 4 sweets, show the children how to share the sweets equally between 2 toys, Teddy and Rover.</li> <li>The children pour out the sweets on to their maths mat, and at the bottom of the mat they stick one post-it for Teddy and another post-it for Rover. They then start sharing equally the sweets between Teddy and Rover until there are none left.</li> <li>At the end emphasise that 'Teddy has half of the 4 sweets, and Rover has half of the 4 sweets. One half of 4 is 2.' You may write this symbolically for the children to see '1/2 of 4 = 2'</li> </ul>	When finding quarters, do children realise how many quarters <i>Teddy, Rover</i> have together? ( <i>two quarters</i> : if appropriate, you could write this as $^2/_4$ ), Taking this further, do children see how many quarters <i>Teddy, Rover</i> and <i>Rabbit</i> have together?' ( <i>three</i> <i>quarters</i> : you could write this as $^3/_4$ ). Do the children recognise the equivalence between $^2/_4$ and $^1/_2$ of a number of sweets?

### PROBLEM-SOLVING EXAMPLES FOR DEVELOPING MASTERY IN LOWER PRIMARY

<ul> <li>Repeat the demonstration with the bag of 8 sweets. This time one half is</li> <li>Explain that between them Teddy and Rover actually have 'two halves' and in each example ask the children 'How many sweets in two halves?'</li> </ul>
<ul> <li>Now Emily and Luke <i>share</i> the bag of 12 sweets <i>equally</i> between <i>Teddy</i> and <i>Rover</i>. They need to agree what is <i>one half</i> of 12.</li> </ul>
Repeat this with the bag of 16 sweets.
Quarters: Sharing equally between four toys:
<ul> <li>Now explain that <i>Froggy</i> and <i>Rabbit</i> have also come to play with <i>Teddy</i> and <i>Rover</i>. How many will need to share the sweets altogether now? If necessary, demonstrate sharing equally between 4, to find <i>one quarter</i>, using <sup>1</sup>/<sub>4</sub> of 4 and then <sup>1</sup>/<sub>4</sub> of 8, before asking them to share the 12 and the 16.</li> </ul>
